

FLEXIPRESS

Description

Flexipress is a mechanic press, specific for punching and small embossing processes, with a fixed stroke and a high capacity.

The machine is equipped with an electro welded and stabilized frame.

4 guiding columns drive the mobile mass, allowing de-centering the dies, being able to work at any part of the table surface, such as cutting.

The eccentric shaft, set in the lower part, with pneumatic clutch and double safety pneumatic valve, is driven by an asynchronous motor and frequency variation.

Crankshaft in lower side. Drive transmission by belt and electro-pneumatic clutch-brake

Mechanization of lower table to allow scrap's fall and tooling to be referenced.

Automatic lubrication with centralized recirculation of oil, guarantees the mechanic stability.

The high working speed, up to 150 strokes per minute, depending on the types, allows a high production.

The Flexipress has a comprehensive fairing, in order to protect the operator, including the door closed detectors, linked to the line control.

The press is controlled from the band feeder electronic.

Advantages

- All the required tools belonging to the same family (or more families) are set on the table.
- Every tooling is individually driven by a selector.
- Total flexibility for variable band feeding.

Servo motorized version

- Higher productivity.
- Total flexibility to modify the speed.
- Better control for the line feeding synchronization and the punching cycle, especially when increasing the quantity and the complexity of the holes.

Flexipress is an essential element for the metallic parts flexible and continuous manufacturing systems

Flexipress in a flexible punching and rollforming line for highway safety barriers manufacturing.

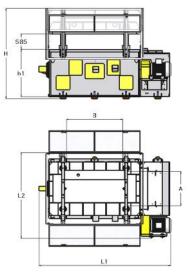

FLEXIBLE PUNCHING
